

CN Assignment-3

Name: Manan Aggarwal

Roll Number: 2022273

Q1. (A) The setup for the assignment is as follows:

4 VMs were made on VirtualBox with the configuration: 1 core, 512 MB RAM, 20 GB HDD, Debian (64-bit), these were named: client, gateway, server1, server2

2 Host only networks were made within VirtualBox, one for the ip range 20.1.1.0/24 and another for the ip range 40.1.1.0/24 with DHCP off, named VirtualBox Host-Only Ethernet Adapter and VirtualBox Host-Only Ethernet Adapter #2

Client was connected to the VirtualBox Host-Only Ethernet Adapter. (enp0s3)

Gateway has 2 interfaces, with one connected to VirtualBox Host-Only Ethernet Adapter (enp0s3) and another one to VirtualBox Host-Only Ethernet Adapter #2 (enp0s8)

Server1 was connected to VirtualBox Host-Only Ethernet Adapter #2 (enp0s8)

Server2 was also connected to VirtualBox Host-Only Ethernet Adapter #2 (enp0s8)

The interfaces were set up within the virtual machines with the following configurations at /etc/network/interfaces file and then rebooted.

Client:

```
client@client:~$ cat /etc/network/interfaces
# This file describes the network interfaces available on your system
# and how to activate them. For more information, see interfaces(5).

source /etc/network/interfaces.d/*

# The loopback network interface
auto lo
iface lo inet loopback

# The primary network interface
allow-hotplug enp0s3
iface enp0s3 inet static
    address 20.1.1.1
    netmask 255.255.255.0
    gateway 20.1.1.2
# This is an autoconfigured IPv6 interface
iface enp0s3 inet6 auto
client@client:~$ _
```

```
client@client:~$ /sbin/ifconfig

    TX packets 0 bytes 0 (0.0 B)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

server2@server2:~$

```

(B) Even Though everything was correctly setup, when I tried pinging server1 from the client it resulted in 100% packet loss

```

client@client:~$ ping 40.1.1.1 -c 10
PING 40.1.1.1 (40.1.1.1) 56(84) bytes of data.

--- 40.1.1.1 ping statistics ---
10 packets transmitted, 0 received, 100% packet loss, time 9203ms

client@client:~$ _

```

This was setup by enabling ipv4 forwarding on the gateway machine

```

sudo sysctl -w net.ipv4.ip_forward=1

client@client:~$ ping 40.1.1.1 -c 10
PING 40.1.1.1 (40.1.1.1) 56(84) bytes of data.
64 bytes from 40.1.1.1: icmp_seq=1 ttl=63 time=104 ms
64 bytes from 40.1.1.1: icmp_seq=2 ttl=63 time=2.23 ms
64 bytes from 40.1.1.1: icmp_seq=3 ttl=63 time=2.72 ms
64 bytes from 40.1.1.1: icmp_seq=4 ttl=63 time=2.70 ms
64 bytes from 40.1.1.1: icmp_seq=5 ttl=63 time=3.23 ms
64 bytes from 40.1.1.1: icmp_seq=6 ttl=63 time=2.21 ms
64 bytes from 40.1.1.1: icmp_seq=7 ttl=63 time=4.35 ms
64 bytes from 40.1.1.1: icmp_seq=8 ttl=63 time=2.47 ms
64 bytes from 40.1.1.1: icmp_seq=9 ttl=63 time=2.35 ms
64 bytes from 40.1.1.1: icmp_seq=10 ttl=63 time=2.21 ms

--- 40.1.1.1 ping statistics ---
10 packets transmitted, 10 received, 0% packet loss, time 9013ms
rtt min/avg/max/mdev = 2.209/12.891/104.442/30.523 ms
client@client:~$ _

```

Running the above command fixed the issue, and i was able to successfully ping server1

Q2. (A) In order to drop all packets except ping packets (which are icmp-echo packets [source](#)), I first added an iptable rule to forward icmp echo-request and icmp echo-reply packets then drop all the remaining packets

```
sudo iptables -A FORWARD -d 40.1.1.1 -p icmp --icmp-type echo-request -j ACCEPT
sudo iptables -A FORWARD -s 40.1.1.1 -p icmp --icmp-type echo-reply -j ACCEPT
sudo iptables -A FORWARD -d 40.1.1.1 -j DROP
```

This allowed me to ping server1 but be unable to connect to it through netcat

```
client@client:~$ ping 40.1.1.1
PING 40.1.1.1 (40.1.1.1) 56(84) bytes of data.
64 bytes from 40.1.1.1: icmp_seq=1 ttl=63 time=104 ms
64 bytes from 40.1.1.1: icmp_seq=2 ttl=63 time=3.07 ms
64 bytes from 40.1.1.1: icmp_seq=3 ttl=63 time=2.41 ms
^C
--- 40.1.1.1 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2003ms
rtt min/avg/max/mdev = 2.409/36.555/104.192/47.826 ms
client@client:~$ nc 40.1.1.1 8888
hi
^C
client@client:~$ _
```

```
server1@server1:~$ nc -l -p 8888
^C
server1@server1:~$ _
```

(B) In order to drop only the tcp packets from source address 20.1.1.1, i ran

```
sudo iptables -A FORWARD -s 20.1.1.1 -p tcp -j DROP
```

This resulted in the following:

<pre>client@client:~\$ nc -u 40.1.1.3 8888 hi hi ^C client@client:~\$ nc 40.1.1.3 8888 hi ^C client@client:~\$ _</pre>	<pre>server2@server2:~\$ nc -lu -p 8888 hi hi ^C server2@server2:~\$ nc -l -p 8888 ^C server2@server2:~\$</pre>
--	---

Since all the packets were being dropped where destination is server1, I decided to test the configuration on server2. Even Though the UDP connection went through and transferred data, the TCP connection did not go through and blocked the data

Q3 (A) To run iperf on the server I ran

```
iperf -s
iperf -u -s
```

To test TCP and UDP connections I ran:

```
iperf -c 40.1.1.3
iperf -u -c 40.1.1.3
```

```
server2@server2:~$ iperf -s
-----
Server listening on TCP port 5001
TCP window size: 128 KByte (default)
-----
^Cserver2@server2:~$
```

```
client@client:~$ iperf -c 40.1.1.3
-----
Client connecting to 40.1.1.3, TCP port 5001
TCP window size: 16.0 KByte (default)
-----
^C^Cclient@client:~$
```

```
server2@server2:~$ iperf -u -s
-----
Server listening on UDP port 5001
UDP buffer size: 208 KByte (default)
-----
[ 1] local 40.1.1.3 port 5001 connected with 20.1.1.1 port 43919
[ ID] Interval      Transfer    Bandwidth      Jitter    Lost/Total Datagrams
[ 1] 0.0000-10.0152 sec 1.25 MBytes 1.05 Mbits/sec 0.352 ms 0/895 (0%)
^Cserver2@server2:~$
```

```
client@client:~$ iperf -u -c 40.1.1.3
-----
Client connecting to 40.1.1.3, UDP port 5001
Sending 1470 byte datagrams, IPG target: 11215.21 us (kalman adjust)
UDP buffer size: 208 KByte (default)
-----
[ 1] local 20.1.1.1 port 43919 connected with 40.1.1.3 port 5001
[ ID] Interval      Transfer    Bandwidth      Jitter    Lost/Total Datagrams
[ 1] 0.0000-10.0158 sec 1.25 MBytes 1.05 Mbits/sec
[ 1] Sent 896 datagrams
[ 1] Server Report:
[ ID] Interval      Transfer    Bandwidth      Jitter    Lost/Total Datagrams
[ 1] 0.0000-10.0152 sec 1.25 MBytes 1.05 Mbits/sec 0.351 ms 0/895 (0%)
client@client:~$
```

From the configuration of Q2 we had blocked all the TCP traffic from 20.1.1.1 therefore iperf could not establish a TCP connection and hence did not give any output. In case of UDP the connection was successful and we got a data transfer rate of 1.05 Mbits/sec

(B) I used ping to check the RTT from 20.1.1.1 to 40.1.1.1 and 40.1.1.3

```
ping 40.1.1.1
ping 40.1.1.3
```

```
client@client:~$ ping 40.1.1.1 -c 10
PING 40.1.1.1 (40.1.1.1) 56(84) bytes of data.
64 bytes from 40.1.1.1: icmp_seq=1 ttl=63 time=104 ms
64 bytes from 40.1.1.1: icmp_seq=2 ttl=63 time=2.47 ms
64 bytes from 40.1.1.1: icmp_seq=3 ttl=63 time=2.94 ms
64 bytes from 40.1.1.1: icmp_seq=4 ttl=63 time=3.12 ms
64 bytes from 40.1.1.1: icmp_seq=5 ttl=63 time=3.04 ms
64 bytes from 40.1.1.1: icmp_seq=6 ttl=63 time=2.09 ms
64 bytes from 40.1.1.1: icmp_seq=7 ttl=63 time=3.07 ms
64 bytes from 40.1.1.1: icmp_seq=8 ttl=63 time=3.14 ms
64 bytes from 40.1.1.1: icmp_seq=9 ttl=63 time=2.80 ms
64 bytes from 40.1.1.1: icmp_seq=10 ttl=63 time=3.28 ms

--- 40.1.1.1 ping statistics ---
10 packets transmitted, 10 received, 0% packet loss, time 9015ms
rtt min/avg/max/mdev = 2.094/12.955/103.597/30.215 ms
```

(i)

Min RTT = 2.094 ms

Max RTT = 103.597 ms

Avg RTT = 12.955 ms

```
client@client:~$ ping 40.1.1.3 -c 10
PING 40.1.1.3 (40.1.1.3) 56(84) bytes of data.
64 bytes from 40.1.1.3: icmp_seq=1 ttl=63 time=102 ms
64 bytes from 40.1.1.3: icmp_seq=2 ttl=63 time=2.29 ms
64 bytes from 40.1.1.3: icmp_seq=3 ttl=63 time=2.66 ms
64 bytes from 40.1.1.3: icmp_seq=4 ttl=63 time=2.02 ms
64 bytes from 40.1.1.3: icmp_seq=5 ttl=63 time=1.70 ms
64 bytes from 40.1.1.3: icmp_seq=6 ttl=63 time=3.51 ms
64 bytes from 40.1.1.3: icmp_seq=7 ttl=63 time=2.78 ms
64 bytes from 40.1.1.3: icmp_seq=8 ttl=63 time=2.66 ms
64 bytes from 40.1.1.3: icmp_seq=9 ttl=63 time=3.22 ms
64 bytes from 40.1.1.3: icmp_seq=10 ttl=63 time=2.25 ms

--- 40.1.1.3 ping statistics ---
10 packets transmitted, 10 received, 0% packet loss, time 9018ms
rtt min/avg/max/mdev = 1.704/12.545/102.365/29.944 ms
```

(ii)

Min RTT = 1.704 ms

Max RTT = 102.365 ms

Avg RTT = 12.545 ms

(iii) There is not much difference between the RTTs of 40.1.1.1 and 40.1.1.3 from the client. Server2 has slightly lower Avg RTT from that of Server1. This might be attributed to the fact that we are applying more iptables filters on 40.1.1.1 than 40.1.1.3

Q4 The previous config was result by flushing the iptable using

```
sudo iptables -F
```

(A) To change the SNAT source to 40.1.1.2 for the packets which come from 20.1.1.1

```
sudo iptables -t nat -A POSTROUTING -s 20.1.1.1 -j SNAT --to-source 40.1.1.2
```

(B) To change the DNAT destination to 20.1.1.1 for the packets which have destination as 20.1.1.2

```
sudo iptables -t nat -A PREROUTING -d 40.1.1.2 -j DNAT - - to-destination 20.1.1.1
```

(C) I ran tcpdump on client, gateway and server1 in background and then connected client and server1 through netcat

```
sudo tcpdump &
```

Server1:

```
server1@server1:~$ nc -l -p 8888

```

All the requests received on server1 had source IP as 40.1.1.2 and the requests received on client had destination ip as 20.1.1.1 indicating that the NAT was successfully set up

Q5 (A) in question 3 it was seen that server2 has slightly lower RTT than that of server1

```
sudo iptables -A PREROUTING -t nat -d 20.1.1.2 -m statistic --mode random --probability 0.2 -j DNAT --to-destination 40.1.1.1
sudo iptables -A PREROUTING -t nat -d 20.1.1.2 -j DNAT --to-destination 40.1.1.3
sudo iptables -A POSTROUTING -t nat -d 40.1.1.1 -j SNAT --to-source 40.1.1.2
```

```
sudo iptables -A POSTROUTING -t nat -d 40.1.1.3 -j SNAT --to-source 40.1.1.2
```

This ensures that 20% of the time the requests are sent to 40.1.1.1 and 80% the requests are sent to 40.1.1.3

(b) I manually ping 20.1.1.2 from the client 10 times

I also ran

```
sudo tcpdump icmp
```

On both the servers showed that 1 request went through server1 and 9 requests went through server2, this gives a 10% chance of requests going through server1, due to the sample size being small, if we increase the number of requests this would go up.

The reason for not directly pinging the gateway continuously with the -c flag is that when a ping request is sent the first packet has NEW as its state and after a response further packets are sent with state of ESTABLISHED, since the rules that we have made only correspond to NEW packets therefore all the subsequent requests would be sent to the server where the first request was sent ([source](#))

Server1:

```
server1@server1:~$ sudo tcpdump icmp
tcpdump: verbose output suppressed, use -v[v]... for full protocol decode
listening on enp0s3, link-type EN10MB (Ethernet), snapshot length 262144 bytes
